Phone: 03214-261221

Ref No.:

Date: 15/09/2020

Project: Biodiversity Register of Shyampur Siddheswari Mahavidyalaya

Study Team:

Guide Teacher:

Prosenjit Dawn
Dr. Dhruva Chandra Dhali
Dr. Mohua Das

	Name of the Student	Responsibility
1	Suprakash Adak	Data collection and curation + Photography
2	Soumyadip Santra	Data collection and curation + Photography
3	Sridipta Manna	Data collection and curation + Photography

Biodiversity data would be collected in excel format and a consolidated report will be prepared at the end of the project.

To avoid physical contact in Covid-19 pandemic situation, team strength has been reduced and field surveys will be done by individual efforts.

Birds:

Introduction -

Birds are a group of warm-blooded vertebrates constituting the class Aves. Birds are evolved from a group of meat-eating dinosaurs called theropods. Some species of birds can fly and some of them cannot. Different type of birds may have different beaks and depending on these beaks their food intake varies. Based on this, some analysis can be done about their habitat.

The importance of birds in nature is immense. Without birds, our food Web would be destroyed. Birds maintain the balance of the environment by eating insects and prevent further crop damage. Birds Eat many varieties of fruits and help in their seeds disperses. Birds also play an important role as a pollinator to some species of trees. Some scavenger birds also help to detoxify nature and reduce disease.

There are at least 1352 species of birds found in India. There are 872 species of birds found in West Bengal. About 298 species of birds are found in Howrah. And at our Shyampur Siddheswari Mahavidyalaya campus and its surroundings a total 76 species of birds were recorded.

Butterfly:

Introduction-

Butterflies are insects from the order Lepidoptera. In Greek language Lepido means 'Scale' and Ptera means 'Wing'. Butterflies and moth's wings are made up of small scales so they are placed in the order Lepidoptera.

Butterflies have 4 stages of its life cycle. The cycle are egg, larvae, pupa and adult butterfly. Butterflies larvae feed on the leaves of various species of trees. Depending on the structure of each butterfly and their behavior ,they took different types of plants leave as food. Some species of butterfly larvae are carnivorous. After completing 4 or 5 molts of the larval stage, the larvae transformed into pupa.

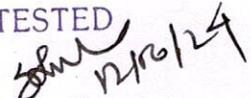

Butterflies are one of the major pollinators. They collect nectors as food and helps in cross pollination. Some butterfly larvae are carnivorous, they feed on Mealybugs. Mealybugs are considered pests as they feed on plant juices. So, butterflies play roles as a biological pest control.

A total number of 943 species of butterflies are found in India. Of these, 439 species are found in our west Bengal. And 97 species of butterflies are found in Howrah. About 65 species of butterflies have been found in shyampur siddheswari mahavidyalaya.
